

Announcing Art Photo Index (API)

Art Photo Index is an innovative, cloud-based visual database containing images from thousands of internationally acclaimed art and documentary photographers.

Our goal is to amass the world's largest online collection of work by established and emerging photo-based artists. API is highly vetted — only artists who have achieved recognition are invited to participate. Each artist or their representative is responsible for the work and information shown on API.

Our discerning, cultivated audience includes curators, gallerists, publishers, photo writers, picture editors, photographers and collectors, along with others who have a serious interest in contemporary photography.

API Search Engine uses a multitude of artist added keywords to aid picture-seeking viewers to easily explore and discover the diversity of art photography on an international scale.

API Collections uses revolutionary technology allowing viewers to easily drag-and-drop images from any page directly into their own personal collections.

API Alerts inform viewers when artists they follow upload new work.

API World Map is an interactive geographical representation of where artists are located. Click a pin and view the artists located in a particular city. Click their website screenshot and go directly to see more work by that artist.
